Lesson 2- Assignment 01- Git Workflow

Solution

Execute the following steps:

- Use '**git init'** to create a new repository
- Be sure to be in a clean state by typing **git status**. Git should say "nothing to commit, working directory clean"
- Create a new file touch **abc.txt**
- Using **git status** verify that **abc.txt** is untracked
- Add this file to the staging area **(git add)**so that Git can start tracking it
- Use the suggested '**git reset HEAD <file>**' command to back the file in the untracked status
