INSTALLING GIT IN MAC

A step-by-step tutorial to help you install Git in your Mac.

Disclamer: This tutorial aims at helping you install Git with basic configurations. It facilitates you to execute all the codes and perform all Git operations, discussed in this course, easily.

Git can be installed in a Mac system using the following methods:

Method 1:

1. Download Git from http://git-scm.com/downloads.

2. To execute the installer, select default settings, which includes all the windows that appear during the installation.

3. Execute "git --version" to verify your installation. This should output the appropriate Git version.

Method 2:

Use the packet manager Homebrew (brew.sh)

- $ brew install git
- $ git --version
